// clone_lib="nil" Hib_BmAk=FV0"
// clone_lib="nil" Hib_mans constructed according Site_2: Not I: The library was constructed according Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarcse gel: First strand cDNA synthesis was primed with Oligo-dry primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with ECOR I adaptor, digested with NotI and then cloned directionally into pXY-Asc vector. The library tag sequence located between the Not I site and the polyA tail is AcCGAGACAG. This library was created for the University low Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Montal Health (NIMH), Hemin Chin, Ph.D.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A nucleic acid molecule (AAT72725) codes for a fusion protein (AAW19764) comprising granulocyte-macrophage colony stimulating factor (GM-GSF) and Her2, a growth factor receptor that is over-expressed in breast and ovarian cancer cells. It was prepd. by PCR amplification of Her2 cDNA from a breast cancer cell line and fusion to GM-GSF cDNA. Fusion expression vectors can be used to transfect mammalian and insect cells. The Her2-GM-GSF cision protein is used to generate anti-Her2 immunity. Tumour cells are eliminated by cytocoxic T lymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the
                                                                                                                                                                                                                                                                                                                           Potent APC that activates T-cells to give multivalent cellular immune response - can also induce a cytotoxic T-cell response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2385

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       80
                                                                                                                                                                                                                                                              The present sequence encodes the human HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat an alignancies such as breast, ovarian, colon, lung and

normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Ly8676-Vall255) of the HER-2/n protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellul domain in transformed host cells, or are used, alone or in a vira vector, for genetic immunisation of an animal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         t

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (1.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 B-cell group derived from the human/murine FGR8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human and the prostate of prostate/breast or breast cancer when the PA is human and the part of

```
New antigen-presenting cells, useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly useful for treating or preventing cancer, e.g. breast cancer
```

Claim 1; Page 41-46; 49pp; English

The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/new protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/new protein, particularly in treating or preventing malignancies in which the HER-2/new oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/new protein (also known as pl85 or c-erbb2).

 The invention relates to inhibiting expression of a target gene in a cell
by introducing at least two oligoribonuclectides (dsRNAI and II), both
comparison that least part of one strand (s1, S2) of the ds structures in each
comparison of dsRNAI and II are complementary to regions in the target gene. The
method uses antisense inhibition of gene expression using double stranded
comparison (RNAI). The method is particularly used to treat tumours
comparison is especially by Plasmodium or viruses/viroids (pathogenic on
humans, animals or plants). The method provides more effective inhibition
comparison than known methods using a single dsRNA, even at very low
concentrations. When dsRNA has at least one unpaired nucleotide at the
concentrations when dsRNA has at least one unpaired nucleotide at the
concentrations when dsRNA has at least concentration in the cell) is
comproved and efficiency can be increased further by pretreating the cells
with interferon. The present sequence is that of a target DNA of the

This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (daRNAI) that has a double stranded that setzended (daRNAI) that has a double stranded to the target gene and the calls are treated with interferon before introduction of daRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) to protein genes; developmental or prion genes, or genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic organisms, animals or plants). Treating the cells with interferon greatly increases the extent to which daRNA can inhibit interferon greatly increases the interferon greatly increases the extent to which daRNA can inhibit are modified to increase their stability. ABX09936-ABX10075 represent gene fragments used to illustrate the method of the invention.

 The invention relates to a transgenic non-human mammal that produces in its mammary gland cells detectable levels of a native human HER2 protein or its fragment. The transgenic animals are useful as tumour models for testing HER2-directed cancer therapies, and for identifying anticancer agents. The animals may also be used as source of cells which can be immortalised in culture, in screening for compounds that have potential as prophylactic or therapeutic treatments of diseases or disorders involving expression of HER2. The anti-cancer molecules are useful for inducing apoptosis or cell death of cancer cells. The present sequence is human HER-2 cDNA.
 New transgenic non-human mammal that produces detectable levels of a native human HER2 protein in its mammary gland cells, useful as tumor models for testing HER2-directed cancer therapies, and for identifying anticancer agents

The method comprises administering the polypeptide antigen or at least one variant which includes at least one first T-helper cell epitope that is foreign to the animal (foreign TH epitope) and is formulated with chitosan. The polypeptide antigen is weakly immunogenic or non-immunogenic. The invention is used as vaccine. The chitosan and polypeptide antigen or its variant are useful in the preparation of an immunogenic composition for inducing or enhancing an immune response, particularly CTL response, against the polypeptide or protein antigen. The method for inducing or enhancing an immune response is useful in treating or ameliorating cancer, e.g. prostate or breast cancer. The present sequence is human Her2 antigen DNA.

1801 CCCAGCGGTGTGAAACCTGACCTCTCCTACATGCCCATCTGGAAGTTTCCAGATGAGAG 1860
 The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least part of one strand has an overhang of 1-4 nuclectides. The method is used to inhibit the has an overhang of 1-4 nuclectides. The method is used to inhibit the humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
 Inhibiting expression of target gene, useful e.g. for inhibiting oncogenes, by administering double-stranded RNA complementary to target and having an overhang

 The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for the therapy and diagnosis of cancer. The composition is useful for the therapy and diagnosis of cancer. The compositions of cancer. The compositions of cancer is and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/New polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating an T cell response in a patient. The invention is useful for stimulating a T cell response in a calculatively form duplex molecules with complementary stretches of the entire Her-2/New gene fragments of interest, to isolate a full length gene from a suitable library, and to direct expression of a colypeptide in appropriate host cells. The composition is useful in prophylactic or therapeutic applications and for the treatment of cancer, preferably for the immunotherapy of breast cancer and other Her-2/Neu

 The present sequence is that of human Her-2/neu oncogene cDNA.

The cDNA encodes Her-2/neu (p185), an oncogenic self protein and target for anti-cancer vaccines. The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu is a member of the tyrosine kinase family of receptor-like glycoporteins.

Its overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins of the tusion proteins or nucleic acid molecules. In preferred fusion proteins or nucleic acid molecules. In proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In protein is fused to a Her-2/neu intracellular domain of a Her-2/neu protein in the form of a vaccine, or by cresponse to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells contained the transfected cells of the animal. The fusion protein, and delivering the transfected cancer, especially breast, ovarian, colon, lung or prostate cancer.

The protein is that specifically react with a Her-2/neu cancer, especially that specifically preact with a Her-2/neu.

The invention relates to a method for inhibiting development of haematological malignancy in a patient by administering a polypeptide comprising an immunogenic portion of Her-2/neu or a polynuclectide encoding the polypeptide. Antique presenting cells that express the protein can also be administered. The sequences are used for inhibiting development of haematological malignancy such as acute myelogenous leukaemia (AML), chronic myelogenous leukaemia (CML), chronic lymphocytic leukaemia (CLL), MDS, myelomas, Hoddykin's lymphoma and non-Hodgkin's lymphoma. This sequence represents DNA encoding human Her-2/neu

 The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonuclectide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonuclectides for antisense inhibition of gene expression useful carected against genes present in pathogens (e.g. lasmodium or directed against genes present in pathogens (e.g. lasmodium or cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known captures, probably because the unpaired overhang increases captulity and thus intracellular concentration.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

to an EcoR I adaptor, digested with Not I, and cloned directionally into pTyT3-Pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GTCC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

Site_l: NotI: The poly (A)* RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was sigated with DNA-RNA linker including ECOR I site by treatment of T4 RNA ligase and the first strand CDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The CDNA vector was adjusted to have about 60nt. The CDNA vector was circularized with E. coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOf* by electroporation method. The CDNA libraties constructed by this method are full-length enriched CDNA library. After analyzing and

sequencing about 2,000 - 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5 primer and N(dT)14 as 3 primer. The PCR products were used as template for synthesis of biotinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA libraries were constructed by transformation of the remaining DNA into competent cells E. coli ToplOF' with electroporation method.

The present sequence is that of CDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) murine Her 2/neu oncoprotein (see AAM51151). The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of human cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu tusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the ECD of Her-2/neu is fused to a Her-2/neu intracellular domain or PD (or its Deltapp fragment) and minus response to Her-2/neu protein is elicited or enhanced by administering the fusion protein is elicited or enhanced by cancellular domain and delivering the transfected cells of an animal ex vivo with a nucleic acid encoding the fusion protein in and delivering the development of a specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or

Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 The present sequence is that of cDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) and the phosphorylation domain (PD) armine Her-Z/neu oncoprotein (see AAMS)1131) plus a C-terminal TCPO motif that improves immunogenicity. The Her-Z/neu qene is amplified and the oncoprotein is overexpressed in a variety of muman cancers. Including breast, ovarian, colon, lung and prostate cancer. Her-Z/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-Z/neu fusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins, the ECD of Her-Z/neu is fused to a characterlular domain or PD (or its DeltaPD fragment). An immune response to Her-Z/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by cancer, especially breast, ovarian, collect acids encoding the fusion proteins, nucleic acids, and isolated encoding the fusion proteins, nucleic acids, and isolated concer, especially breast, ovarian, collect acids, and isolated concer, in a patient. T cells that specifically react with a Her-Z/neu cancer in a patient. T cells that specifically react with a Her-Z/neu in a sample in

effective for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is human leukocyte antigen (HLA)-144 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer, preferably breast cancer, in pharmaceutical compositions, e.g., vaccine and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating a T cell response in a human patient, as probe or primer for nucleic acid hybridisation, to

The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for eliciting an immune response in a patient, where the patient is human leukocyte antigen (HLA)-B44 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer. The compositions for the diagnosis, prevention and treatment of can do other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating a T cell response in a human patient, as probe or primer for nucleic acid hybridisation, to selectively form duplex molecules with complementary stretches of the entire Her-2/Neu gene or gene fragments of interest, to isolate a full length gene from a suitable library, and to direct expression of a
 polypeptide in appropriate host ceils. The composition is useful in prophylacitic or therapeutic applications and for the treatment of cancer, preferably for the immunotherapy of breast cancer and other Her-2/Neurassociated malignancies. The invention is useful in gene therapy. The
 present sequence is human cDNA for the clone HICD_plus_8_HIS.

flaviviruses and pestiviruses. The present sequence represents the coding sequence of human breast cancer antigen, Her2 variant, used as a target
 The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumour cells or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynucleotide (II) by a cell. This is done by administering a polynucleotide (II) exocding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pancreatic cancer, as well as lymphomas and leukacemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lentiviruses (including human immunodeficiency virus (HIV)), herpesviruses and the

 The present sequence encodes the human HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against

 Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbB2) protein (AAW01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the CDNA sequence code for the intracellular domain (Ly8676-Val1255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral

 The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (1.e. self-proteins), for example, human prostate specific membrane antigen (PSM), herequin 2 (Her2) and/or fibroblast growth factor 8b (FGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 B-cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
 human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate, prostate, prostate, prostate, prostate, and the part of Dalum I;
 Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer

The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/neu protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly in treating or preventing malignancies in which the HER-2/neu oncogene is associated Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/neu protein (also known as p185 or c-erbB2).

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (GSRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (SI, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the

Inhibiting expression of target genes, e.g. oncogenes, in cells, b introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon WPI; 2002-742209/81.

Disclosure; Page 43-44; 98pp; German

This invention describes a novel method for inhibiting expression of a target gene at least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, particularly nocogenes, or genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (parthogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit are modified to increase their stability, ABX09936-ABX10075 represent 2959 GTGGTCATCCAGAATGAGGACTTGGGCCCAGCCAGTCCCTTGGACAGCACCTTC 3012 13 ValThrPheGlnAsnGluAspLeuGlyProAlaSerProLeuAspSerThrPhe 30 gene fragments used to illustrate the method of the invention Sequence 3768 BP; 758 A; 1170 C; 1121 G; 719 T; 0 other; 0000 Conservative: Mismatches: Length: Matches: Indels: JUNC\_SEQ8\_SEQ5 (1-30) x ABX09987 (1-3768) 83.00 88.89% 88.89% 51.88% Percent Similarity: Best Local Similarity: Alignment Scores: Query Match: Pred. 222222222222222222 ò

to an EcoR I adaptor, digested with Not I, and cloned directionally into p773-Pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GTCC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (REI).

PCR reaction using vector region primer including T7 promotor as 5' primer and N(dT)14 as 3' primer. The PCR products were used as template for synthesis of biotinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA libraries were constructed by transformation of the remaining DNA into competent cells E. coli ToplOF' with electroporation method.

The presult sequence is that on the phosphorylation domain (PD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAM51151). The Her-2/neu gene is multine Her-2/neu oncoprotein (see AAM51151). The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of fumban cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu cancer. Her-2/neu ovarian cancers. The invention provides Her-2/neu fusion proteins, the ECD of Her-2/neu is fused to a Her-2/neu intracellular domain or PD (or its DeltapD fragment). An excines comprising the fusion protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid emcoding the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid colon, the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in corder to inhibit the development of cancer in a patient.
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 The present sequence is that of cDNA encoding a fusion between

Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 The present sequence is that of cDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAMS1131) plus a C-terminal TCPO motif that improves immunogenicity. The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of human cancers. Including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the ECD of Her-2/neu intracellular domain or PD (or its DeltaPD fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by conding the fusion protein in the form of a vaccine, or by conding the fusion protein, nucleic acids, and isolated encoding the fusion protein, nucleic acids, and isolated concern the animal. The fusion protein, nucleic acids, and isolated concern concern the animal. The fusion protein is elicited or engaged cells of the fusion protein, nucleic acids, and isolated cancer, especially presst, ovarian, colon, lung or protein encorrer in a patient. T cells that specifically react with a Her-2/neu fusion protein concerned in a patient. T cells that specifically react with a Her-2/neu
 order to inhibit the development of cancer in a patient.

Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are proteins AAB58711 - AAB59128. The DNA and protein sequences are sascoitated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AB59129 which are used in the invention and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic, neuroprotective; antivital; antiallergic; hepatotropic; antidabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antidabetic; antiparasitic and cardiant activity. The cylubacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis, proteins, agonists and agonists may also be used in the diagnosis, proteins, agonists and agonists may also be used in the diagnosis, proteins and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as myocardial anoxia and epilepsy; and infectious diseases.
New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases

The invention relates to an isolated Her-2/Neu polypeptide composition effective for eliciting an immune response. The invention is useful for eliciting an immune response. The invention is useful for leukocyte antigen (HLA)-B44 positive or is affected with breast cancer. The composition is useful for the therapy and diagnosis of cancer, preferably breast cancer, in pharmaceutical compositions, e.g., vaccine and other compositions for the diagnosis, prevention and treatment of human malignancies, for stimulating and/or expanding T cells specific for Her-2/Neu polypeptide and for inhibiting the development of cancer in a patient. The invention is useful for stimulating a T cell response in a human patient, as probe or primer for nucleic acid hybridisation, to

The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example timnour cells, or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynuclectide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pencreatic cancer, as well as lymphomas and leukaemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lentiviruses (including human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human breast cancer antigen, Her2 variant, used as a target antigen in the method of the invention.
 Inducing a cell-mediated immune response against a target antigen, reducing undesired cells and stimulating presentation of an antigen a cell, comprises administering a polynucleotide encoding a variant of

 The present sequence encodes the human HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against

This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing
 Use of HER-2/neu polypeptides - for eliciting an immune response an HER-2/neu associated malignancy, particularly for treating or

 Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbB2) protein (AAW01111). The oncogene is overexpressed in various
 cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the CDNA sequence odde for the intracellular domain (Ly8676-Val1255) of the HBR-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.

AB235744
 The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (1.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
 human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human

The invention provides an isolated antigen-presenting ceil, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/neu protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/neu protein, particularly in treating or preventing malignancies in which the HER-2/neu oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/neu protein (also known as pl85 or c-erbB2).

Inhibiting expression of target genes, useful e.g. for trea' by introducing into cells two double-stranded RNAs that are
 Claim 13; Page 38-39; 100pp; German.
 complementary to the target
```

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (GSRNAI and II), both with a double-stranded (4s) structure of at most 49 sequential nucleotide pairs. At least part of one strand (51, \$2) of the ds structures in each of dssRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by prefreating the cells with interferon. The present sequence is that of a target DNA of the Invention

δ Inhibiting expression of target genes, e.g. oncogenes, in cells, by introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon

Disclosure; Page 43-44; 98pp; German

```
This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsnN1) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsnNaI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, id (not defined) to protein genes; developmental or prion genes, or genes expressed in pathogenic organisms (particularly plasamodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsnNa can inhibit interferon greatly increases their stant the effect is even greater when dsnNa care modified to increase their stability. ABX09936-ABX10075 represent gene fragments used to illustrate the method of the invention.

CDNA Library Preparation: M.B. Soares Lab Clone distribution:
clones will be available through Research Genetics (www.resgen.com)
This clone is also available through the I.M.A.G.E. Consortium at Seq primer: M13 Forward.
 been derived was used as a driver in a hybridization with
the pooled UI-R-Al and UI-R-El library in the form of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
 hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
 Bonaldo,M.F., Lennon,G. and Soares,M.B. Normalization and subtraction: two approaches to facilitate gene

 /clone_libs_AFF024-subtracted library"
/clone_libs_AFF024-subtracted library"
/clone_libs_AFF024-subtracted library"
/cote="Organ: Fetal Liver; Vector: Sport 1; Site_1: Sal I;
Site_2: Not I: Two directionally cloned cDNA libraries
were made from a hematopoietic stem cell-supporting
stromal cell line (AFT024) and from a non-supporting
stromal cell line (2018). Subtractive hybridization was
performed by hybridization of the target, AFT024, single
stranded cDNA library in pSport1 to biotinylated RNA
transcribed from the driver, 2018 cDNA library in pSport2
with inserts cloned in the complementary orientation. The
AFT024-subtracted library contains 4.2x105 clones and is
depleted of common housekeeping gene products eg.
beta-actin and enriched for transcripts specific to
AFT024. For detailed protocols and additional information
please see our website at
http://stromalcell.princeton.edu."
 DESGLUGS 592 bp MRNA linear EST 21-JUL-2000 601272225F1 NCI_CGAP_Maml Mus musculus cDNA clone IMAGE:3601422 5',
 Email: kmoore@molbio.princeton.edu
These ESTS are derived from a subtracted cDNA library enriched for
gene products expressed by a hematopoietic stem cell-supporting
stromal cell line, AFT024.

Site_2: Not I; The library was constructed according to Bonaldo. Lennon and Soares, Genome Research, 6:791-806,

1996. Denatured mRNW was size fractionated on a 1% agarose gel. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with Not I, and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is GTGCGTGGAA. This library was created for the University of Iowa Mouse Brain Molecular Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous

 1 GluArgGlyCysProAlaGluGlnArgAlaSerProValThrPheGlnAsnGluAspLeu 20
 The present sequence is that of cDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAM51151). The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of human cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu vaccines comprising the fusion proteins, viral vectors, and vaccines comprising the fusion proteins, the ECD of Her-2/neu is fused to a cancer in preferred fusion proteins, the ECD of Her-2/neu is fused to a mimune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by canned the fusion protein in the form of a vaccine, or by canned to the animal. The fusion protein, uncleic acid, and isolated concer, especially breast, ovarian, colon, lung or prostate cancer in a patient. T cells that specifically react with a Her-2/neu in the fusion protein cancer in a patient. T cells that specifically react with a Her-2/neu in the fusion protein cancer in a patient.
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 order to inhibit the development of cancer in a patient.

 AAT01590
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 The present sequence is that of murine Her-2/neu oncogene cDNA.

The CDNA can be obtained by PCR amplification (see ABA92255-56)
from mouse brain RNA. The Her-2/neu oncogene encodes a p185
glycoprotein (see AAM51151). The Her-2/neu gene is amplified and p185 is overexpressed in a variety of cancers, including breast, or the tyrosine kinase family of receptor-like glycoproteins.

Its overexpression correlates with a poor prognosis in breast and covering an encoder seem of the tyrosine kinase family of receptor-like glycoproteins.

Its overexpression correlates with a poor prognosis in breast and proteins, nucleic acides encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the extracellular domain of a Her-2/neu protein is fused to a Her-2/neu intracellular domain or phosphorylation domain (or its DeltaPD fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid encoding the fusion protein, and delivering the transfected cells cenceding the fusion protein, and delivering the development of a cancer, especially breast, ovarian, colon, lung or prostate cancer in a patient. I cells that specifically react with a Her-2/neu fusion protein cance temove tunnour cells from a sample in protein to the inhibit that a semple in protein.

The sequence represents one of the promoters of the rat neu gene;

a second rat neu gene promoter is in AA701589. These promoter are
compared with the human Erb-B2 promoters (AA701589-88) and the mouse
neu promoter (AA701591). The human Erb-B2 gene is one of the mouse
primary genes responsible for the transition of normal breast
epithelial cells towards carcinoma in situ and the subsequent
development of invasive and mateastatic cancer. The Erb-B2
promoter-binding protein, HPBF (see AAR77093-94), induces cell
division on binding to the promoter. In a method for greater
cuccess in early identification and treatment of breast cancer,
the initation step for Erb-B2 gene activity is identified. This
method involves determining the presence of HPBF (relative to its absence
in a normal control) indicates the presence of Gancer and a
decreased chance of long-term survival. Binding of HPBF to the
connecter can be inhibited using antisense oligons can be
 expressed from retro virus or other gene therapy vectors

The composition is useful for the therapy and diagnosis of cancer, preferably breast cancer, in pharmaceutical compositions, e.g., vaccine and other compositions for the diagnosis, prevention and treatment of
polypeptide in appropriate host cells. The composition is useful in prophylactic or therapeutic applications and for the treatment of cance preferably for the immunotherapy of breast cancer and other Her-Z/Neusasociated malignancies. The invention is useful in gene therapy. The present sequence is human cDNA for the clone HICD_native_coding_region.

cell-mediated immune response; tumour; breast cancer; virus infection; prostate cancer; colorectal cancer; pancreatic cancer; lymphoma; leukaemia; hepadmavirus; lentivirus; herpesvirus; human immunodeficiency virus; HIV; flavivirus; pestivirus; gene; ss.
 The present sequence encodes the human HER-2/neu protein. HER-2/neu is a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovvarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against

 Score:
 The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumnour cells.

Creating a subject having undesired cells, for example tumnour cells, for usually infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynuclectide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pancreatic cancer, as well as lymphomas and leukaemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lenturinuses (including human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human breast cancer antigen, HerZ variant, used as a target cantigen in the method of the invention.
 by
of
 Inducing a cell-mediated immune response against a target antigen, reducing undesired cells and stimulating presentation of an antigen a cell, comprises administering a polynucleotide encoding a variant an antigen

Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbb2) protein (AAW01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Lys676-Val1255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.

Cambridgeshire, CBIO 15A, UK E-mail enquiries:
humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
on Nov 200, 2001 this sequence version replaced q1:16555512.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was faintshed as follows unless otherwise noted: all
regions were either double-stranded or sequencing problems, such
chemistry or covered by high quality data (1.e., phred quality) -
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em: EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORNDEP; Information on the WORNDEP
 IMPORTANT: This sequence is not the entire insert of clone RP23-355110 It may be shorter because we sequence overlapping sections only once, except for a short overlap. The true right end of clone RP23-355110 is at 186134 in this sequence. The true right end of clone RP23-35510 is at 186134 in this

Sequencing vector: mis; mivible 394 of reads
Sequencing vector: plasmid; mivible 304 of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 208571 bases at least Q40
Consensus quality: 210766 bases at least Q30
Consensus quality: 210706 bases at least Q30
Insert size: 2197000; agarose-fp
Insert size: 219719; sum-of-contigs
Quality coverage: 8.5 in Q20 bases; agarose-fp
Quality coverage: 8.5 in Q20 bases; agarose-fp
Quality coverage: 7.8 in Q20 bases; agarose-fp
Quality coverage: 7.8 in Q20 bases; are correctly
* NOTE: This is a "working draft' sequence. It currently
* consists of 14 contigs. The true order of the pieces
* is not known and their order in this sequence reford is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

This read has been verified (found to hit its original self in the correct orientation), as part of the I.M.A.G.E. Consortium quality control effort. High quality sequence is defined as having 100 or more base pairs with a phred quality value of 20 or greater, where a sliding window of 4 base pairs with a phred quality value of 15 or greater marks the beginning and end of the sequence. Her-2/neu;

```
The present sequence is that of cDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAMSIIS). The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of human cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins, nucleic acids encoding them, viral vectors, and vacines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the ECD of Her-2/neu is fused to a manner esponse to Her-2/neu is fused to a minan or PD (or its DeltaPD fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by cannot encoding the fusion protein, with a nucleic acid color concert. Specific T-cells are useful for inhibiting the development of a cancer. Specific T-cells are useful for inhibiting the development of a cancer. Specific T-cells that specifically react with a Her-2/neu in a patient. T cells that specifically react with a Her-2/neu for the anner of the anner
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 inhibit the development of cancer in a patient.

 A nucleic acid molecule (AAT72725) codes for a fusion protein (AAM19764) comprising granulocyte-macrophage colony stimulating factor (GM-CSF) and Herz, a growth factor receptor that is over-expressed in breast and ovarian cancer cells. It was prepd. by PCR amplification of Herz cDNA from a breast cancer cell line and fusion to GM-CSF CNNA. Fusion expression vectors can be used to transfect mammalian and insect cells. The Herz-GM-CSF fusion protein is used to generate anti-Herz immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the
 Potent APC that activates T-cells to give multivalent cellular immune response - can also induce a cytotoxic T-cell response in a

The present sequence encodes a peptide of wild type erbB-2 receptor protein, where the splicing event occurs. An alternatively spliced variant of erbB-2 receptor protein, designated SPLICE erbB-2 receptor protein, designated SPLICE erbB-2 receptor protein, has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The conserved cysteine residues, compared to the unspliced protein. The carbb-2 polynucleotide is used to construct probes for detecting a list of a seam of the protein may be used to detect SPLICE erbB-2 in a sample. Agents (e.g. antisense oligonucleotides) which inhibit the expression of SPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SPLICE erbB-2 are useful for treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the

The HER2 proto-oncogene encodes a tyrosine kinase receptor, which functions in cellular signal transduction. The HER2 protein is functions in cellular signal transduction. The HER2 protein is functions in cellular signal transduction. The HER2 protein is two forms: a normal form and a truncated form. The present sequence is the normal form RNA of HER2. The truncated form RNA sequence of HER2 (AAA6126) encodes a protein associated with increased resistance to the growth inhibiting effects of a monoclonal antibody, Herceptin, used in cancer treatment. The truncated form of the transcript contains unique structures not found in the normal form. The present sequence is predictive of Herceptin-resistant canner and detection of the present sequence may therefore be used as a method of diagnosing breast cancer. Other diseases which may be identified by using a similar method to detect other RNA molecules are hyperproliferative conditions, Lupus, erythematosus, psoriasis, inflammation, cardiovascular disease, pain, arthritis, obesity, trauma, Huntingdon's disease or neurological

 Plasmid pITL-HHER2/neu comprises base vector pITL (see AAV21724) and a human HER-2/neu nucleic sequence. pITL-HHER2/neu was used to evaluate the toxicity of anti-tumour vaccination in rats, and in phase I and phase II trials to evaluate polynucleotide vaccination advanced breast cancer. Novel humanised vectors, which can be based on pITL, comprise a human-derived promoter or mammalian nonloque which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells but are capable of extended stable expression of the target sequence, generating an immune response in immunised individuals. The vectors selectively alloit immune responses to the target sequences with little or no immune response to the corporates.
 Humanised polynucleotide vectors - comprising human derived promoter and sequence acceptance site, used for the production of vaccines

 A CONTRACTOR OF THE STATE OF TH
 The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains, where one of the polypeptide chains comprises, a CH1-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, an immunoglobulin light chain). The polypeptide chains further comprise, the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the different (poly)peptides lack an intrinsic affinity for one another and conferent (poly)peptides lack an intrinsic affinity for one another and cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, and processed to the continumas.
 The present sequence is a fusion construct comprising DC8 single-chain FV (scFV) fragment at the N-terminus, extracellular domain of human erbB2 at the C-terminus and a tetramerisation domain between them. This construct was prepared to find out whether an oligomerisation domain characterised in bacterial expression system is applicable for expression of fully functional and secretable recombinant protein in mammalian host cells. This tetrameric construct was not expressed as secretable and fully functional protein in mammalian cells. Hence general applicability of the tetramerisation domain for oligomerisation strategies in mammalian cells was ruled out.

Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbB2) protein (AAW0111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Lys676-Vall255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.

 The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumnour cells or vitally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynuclectide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer. The method can be used to treat prostate cancer, as well as lymphomas and celucated and pancreatic cancer, as well as lymphomas and infections such as those caused by hepadnaviruses, lentviruses (including human immunodeficiency virus (HIV)), herpesviruses and the cancer and present sequence represents the coding sequence of human breast cancer antigen, Her2 variant, used as a target antigen in the method of the invention.
 by
of
 Inducing a cell-mediated immune response against a target antigen, reducing undesized cells and stimulating presentation of an antigen a cell, comprises administering a polynucleotide encoding a variant an antigen

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human protated with cancers (i.e. self-proteins), for example, human protated specific membrane antigen (PSM) herequin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC3) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 Thelper cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and channed CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human contracts.

 This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a mailgnancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.
 ဌ
 Use of HER-2/neu polypeptides - for eliciting an immune response an HER-2/neu associated mallgnancy, particularly for treating or

 The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER.2/neu protein. The antigen-presenting cells are useful as vaccines for elliciting or enhancing an immune response to HER.2/neu protein, particularly in treating or preventing malignancies in which the HER.2/neu oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER.2/neu protein (also known as p185 or c-erbB2).

CC The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (dsRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide compairs. At least part of one strand (S1, S2) of the ds structures in each cof dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded CC method uses antisense inhibition of gene expression using double stranded cor infections, especially by plasmodium or viruses/viroids (pathogenic or humans, animals or plants). The method provides more effective inhibition CC of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the

```
(ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) pototaln genes, particularly oncogenes, cytokine genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. ABX0936-ABX10075 represent gene fragments used to illustrate the method of the invention.

numquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
buring sequence assembly date is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone ame. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequencing problems, such
chemistry or covered by high quality data (i.e., pired quality) >-
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em; EMBL; Sw;
SWISSPROT; Tr;, TREMBL; Wp;, WORNPEP; Information on the WORNPEP
database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-355L10 is
from the RFOI-23 Mouse PAC Library
FOR further details see http://www.chori.org/bacpac/home.htm
 VECTOR: pBACe3.6
IMPORTANT: This sequence is not the entire insert of clone RP23-355LIO it may be shorter because we sequence overlapping sections only once, except for a short overlap. The true right end of clone RP23-355LIO is at 186134 in this sequence. The true right end of clone RP23-438D7 is at 2000 in this

NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 Submitted (01-0CT-2002) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA OO OCt 1, 2002 this sequence version replaced gi:22597589.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
 Only the last 167.6 kb of this clone are being submitted.
The remainder overlaps accession number AC097491 [WICGR project
L11967].

Quality coverage: 9.72 in Q20 bases; sun-of-contigs estimation

* NOTE: This is a 'working draft' sequence. It currently
consists of 8 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

This read has been verified (found to hit its original self in the correct orientation), as part of the I.M.A.G.E. Consortium quality control effort. High quality sequence is defined as having 100 or more base pairs with a phred quality value of 20 or greater, where a sliding window of 4 base pairs with a phred quality value of 15 or greater marks the beginning and end of the sequence. For information on obtaining this clone, please contact information on obtaining this clone, please contact
Info@image.lln.gov.

The present sequence is that of cDNA encoding a fusion between with extracellular domain (ECD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAMSIIS). The Her-2/neu gene is amplified and the oncoprotein is overaxpressed in a variety of human cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu vaccines comprising the fusion proteins or nucleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules. In preferred fusion proteins, the ECD of Her-2/neu is fused to a confine to the intracellular domain or PD (or its DeltaPD fragment). An immune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by canning the fusion protein, and delivering the transfected cells of an animal ex vivo with a nucleic acid and isolated specific T-cells are useful for inhibiting the development of a cancer in a patient. T cells that specifically react with a Her-2/neu cancer in a patient. T cells that specifically react with a Her-2/neu cancer in a patient. T cells that specifically react with a Her-2/neu cancer cancer in this interval of the cancer
 Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 order to inhibit the development of cancer in a patient.

1 AspLysGlyCysProAlaGluGlnArgAlaSerProLeuThrSerGlnAsnGluAspLeu 20
 A nucleic acid molecule (AAT72725) codes for a fusion protein (AAM19764) comprising granulocyte-macrophage colony stimulating factor (GM-CSF) and Her2, a growth factor receptor that is over-expressed in breast and ovarian cancer cells. It was prepd. by PCR amplification of Her2 CDNA from a breast cancer cell line and fusion to GM-CSF CDNA. Fusion expression vectors can be used to transfect mammalian and insect cells. The Her2-GM-CSF fusion protein is used to generate anti-Her2 immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the
 Potent APC that activates T-cells to give multivalent cellular
Immune response - can also induce a cytotoxic T-cell response in a

```
The present sequence encodes a peptide of wild type erbB-2 receptor protein, where the splicing event occurs. An alternatively spliced variant of erbB-2 receptor protein, designated SplicE erbB-2 receptor protein, has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The crbbs-2 polynucleotide is used to construct probes for detecting classorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SplicE erbB-2 in a sample. Agents ceg. antisense oligonucleotides) which inhibit the expression of SPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SplicE erbB-2 are useful for treating cancer. Substances which stimulate SplicE erbB-2 are useful for treating cancer. Substances which stimulate SplicE erbB-2 are useful for treating cancer since which stimulate splicE erbB-2 are useful for treating cancer. Substances which stimulate splicE erbB-2 are useful for treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the central nervous system and wound healing.
 SPLICE erbB-2 receptor protein; cell transformation disorder; cancer; tumor cell proliferation; tissue degeneration; arthropathy; bone resorption; inflammatory disease; degenerative disorder;

The HER2 proto-oncogene encodes a tyrosine kinase receptor, which functions in cellular signal transduction. The HER2 protein is functions in breast cancer. The HER2 receptor mRNA exists in at least two forms: a normal form and a truncated form. The present sequence is the normal form RNA of HER2. The truncated form RNA sequence of HER2 (AAA6126) encodes a protein associated with increased resistance to the growth inhibiting effects of a monoclonal antibody. Herceptin, used in cancer treatment. The truncated form of the transcript contains unique structures not found in the normal form. The present sequence is predictive of Herceptin-resistant cancer and detection of the present sequence may therefore be used as a method of diagnosing breast cancer. Other diseases which may be identified by using a similar method to detect other RNA molecules are hyperproliferative conditions. Lupus erythematosus, psoriasis, inflammation, cardiovascular disease, pain, arthritis, obesity, trauma, Huntingdon's disease or neurological
 /note=""Forms double-stranded region with bases 137-152 of Her2 normal form transcript"

 A CONTRACTOR OF A CONTRACTOR O
 Plasmid pITL-HBER2/neu comprises base vector pITL (see AAV21724) and a human HER-2/neu nucleic sequence. pITL-HHER2/neu was used to cavaluet the toxicity of anti-tumour vaccination in rats, and in phase I trials to evaluate polynucleotide vaccination in advanced breast cancer. Novel humanised vectors, which can be composed on pITL, comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and sequence acceptance site which accepts CDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells sequence, generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the target.
 Humanised polynucleotide vectors - comprising human derived promoter and sequence acceptance site, used for the production of vaccines

 produceable in a mammalian host cell as a secretable and fully functional heterodiamer of two polypeptide chains, where one of the polypeptide chains comprises. a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the different (poly)peptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominibodies have octostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas.
 The patent discloses heterominibodies which are multifunctional compounds
 The present sequence is a fusion construct comprising DC8 single-chain FV (scFV) fragment at the N-terminus, extracellular domain of human erbB2 at the C-terminus and a tetramerisation domain between them. This construct was prepared to find out whether an oligomerisation domain characterised in bacterial expression system is applicable for expression of fully functional and secretable recombinant protein in mammalian host cells. This tetrameric construct was not expressed as secretable and fully functional protein in mammalian cells. This tetrameric construct in mammalian cells. Hence general applicability of the tetramerisation domain for oligomerisation strategies in mammalian cells was ruled out.

 HER-2/neu is
 a member of the tyrosine kinase family of receptor-like glycoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu fusion protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or
 enhancing an immune response to the HER-2/neu protein. It may be used to treat malignancies such as breast, ovarian, colon, lung and prostate cancers, and may be used as an antigen to vaccinate against

Human HER-2/neu oncogene CDNA (AAT40739) codes for HER-2/enu (p185 or c-erbb2) protein (AAW0111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or derequiated expression of an essentially normal gene product. Nucleotides 2026-3765 of the CDNA sequence code for the intracellular domain (Ly8676-Vall255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral

 The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumnour cells or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by administering a polynuclectide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, orlorectal cancer and pancreatic cancer, as well as lymphomas and leukeamias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lentuviruses and the clausing human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human breast cancer antigen, Her2 variant, used as a target.
 Inducing a cell-mediated immune response against a target antigen, reducing undesired cells and stimulating presentation of an antigen by a cell, comprises administering a polynucleotide encoding a variant of

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (PSEBb). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-iymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
 human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human
 Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer

 This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a mailgnancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.

```
The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/new protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/new protein, particularly in treating or preventing malignancies in which the HER-2/new oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/new protein (also known as p185 or c-erbB2).

with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (S1, S2) of the ds structures in each of dsRNAH and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the each stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the
 interferon; oncogene; cytokine; Id; developmental;
 invention relates to inhibiting expression of a target gene in a ce introducing at least two oligoribonuclectides (dsRNAI and II), both
 This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsRNAI) that has a double-stranded
 Inhibiting expression of target genes, e.g. oncogenes, in cells, b introduction of complementary double-stranded oligoribonucleotide, after treating the cell with interferon

das) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRANI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, particularly oncogenes, cytokine genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. ABX0936 ABX10075 represent gene fragments used to illustrate the method of the invention.

Jumilicae (17-007-2001) wellcome first Saniger Institute, Hinklou, Cambridgeshire, CBIO 15A, UK. E-mail enquiries:
humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
nwove.0, 2001 this sequence version replaced gi:16555512.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone and. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em; EMBL; Sw; SWISSPROT; Tr:, TERMEL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP23-355L10 is from ther RPCI-23 Mouse PAC Library constructed by the group of Pieter de Jong.

For further details see http://www.chori.org/bacpac/home.htm
 /clone_lib-"RPC1-23"
17991. .18004
//note-"Sequence from uni-directional primer reads and dGTP big dye terminator reads only."
 IMPORTANT: This sequence is not the entire insert of clone RP23-355110 It may be shorter because we sequence overlapping sections only once, except for a short overlap.
The true right end of clone RP23-355110 is at 186134 in this sequence. The true right end of clone RP23-438D7 is at 2000 in this

Sequencing vector: M13; M7815; 54% of reads
Sequencing vector: Plasmid; n/a; 46% of reads
Sequencing vector: Plasmid; n/a; 46% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 21076 bases at least Q30
Consensus quality: 210706 bases at least Q30
Consensus quality: 210706 bases at least Q30
Insert size: 197000; agarose-fp
Insert size: 212719; sum-of-contigs
Quality coverage: 8.5 in Q20 bases;
Quality coverage: 7.8 in Q20 bases;
A NOTE: This a 'working draft' sequence. It currently
Consists of 14 contigs. The true order of the pieces

* is not known and their order in this sequence record is
 arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 FEATURES
 Meldrim,J., Meneus,L., Mihova,T., Miranda,C., Mlenga,V., Morrow,J., Murphy,T., Naylor,J., Norman,C.H., O'Connor,T., O'Donnell,P., O'Neil,D., Olivar,T.M., Olivar,J., Peterson,K., Pierre,N., Pisani,C., Pollara,V., Raymond,C., Riley,R., Rogov,P., Rothman,D., Stange-Thoman,W., Schauer,S., Severy,P., Spencer,B., Stange-Thoman,N., Stojanovic,N., Subramanian,A., Talamas,J., Tesfaye,S., Theodore,J., Tirrell,A., Travers,M., Trigilio,J., Vossiliev,H., Viel,R., Vo,A., Wilson,B., Wu,X., Wyman,D., Ye,W.J., Policet Submission
 Submitted (01-0CT-2002) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On Oct 1, 2002 this sequence version replaced gi:22597589. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
 - Genome Center
Center: Whitehead Institute/ MIT Center for Genome Research
 Only the last 167.6 kb of this clone are being submitted. The remainder overlaps accession number AC097491 [WICGR project

Consensus quality: 193482 bases at least Q40
Consensus quality: 194189 bases at least Q30
Consensus quality: 194189 bases at least Q30
Consensus quality: 194769 bases at least Q30
Consensus quality: 194769 bases at least Q30
Estimated insert size: 175000; agarose-fp estimation
Estimated insert size: 197308; sum-of-contigs estimation
Quality coverage: 10.95 in Q20 bases; agarose-fp estimation
* NOTE: This is a 'working draft' sequence. It currently
* consists of 8 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

These ESTs are derived from a subtracted cDNA library enriched f
gene products expressed by a hematopoietic stem cell-supporting
stromal cell line, AFT024.
Seq primer: M13Reverse or T7.

/note="Organ: eye; Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site_1: EcoN I; Site_2: Not I;
UI-E-E00 is a cDNA library containing the following tissue(s): fetal eye. The library as constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECON I adaptor, digested with Not I; and cloned directionally into pT773-Pac vector: The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGGGTATACC: This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

Her-2/neu fusion protein for treating or preventing cancer by eliciting or enhancing an immune response to the protein, has Her-2/neu extracellular domain fused to Her-2/neu intracellular or
 The present sequence is that of cDNA encoding a fusion between the extracellular domain (ECD) and the phosphorylation domain (PD) murine Her-2/neu oncoprotein (see AAM51151) plus a C-terminal TCPO motif that improves immunogenicity. The Her-2/neu gene is amplified and the oncoprotein is overexpressed in a variety of human cancers, including breast, ovarian, colon, lung and prostate cancer. Her-2/neu overexpression correlates with a poor prognosis in breast and ovarian cancers. The invention provides Her-2/neu fusion proteins, uncleic acids encoding them, viral vectors, and vaccines comprising the fusion proteins or nucleic acid molecules.
 In preferred fusion proteins, the ECD of Her-2/neu is tused to a large-red fusion proteins, the ECD of Her-2/neu is tused to a large-red fusion proteins, the ECD of Her-2/neu is tused to a large to a dimmune response to Her-2/neu protein is elicited or enhanced by administering the fusion protein in the form of a vaccine, or by transfecting cells of an animal ex vivo with a nucleic acid serocding the fusion protein, and delivering the transfected cells to the animal. The fusion proteins, nucleic acids, and isolated specific T-cells are useful for inhibiting the development of a cancer, especially breast, ovarian, colon, lung or prostetae cancer in a patient. T cells that specifically react with a Her-2/neu fusion protein can be used to remove tumour cells from a sample in
 order to inhibit the development of cancer in a patient.

The present sequence encodes a peptide of wild type erbB-2 receptor protein, where the splicing event occurs. An alternatively spliced variant of erbB-2 receptor protein, designated SPLICE erbB-2 receptor protein, has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The erbB-2 polynucleotide is used to construct probes for detecting discorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbB-2 in a sample. Agents (e.g. antisense oligonucleotides) which inhibit the expression of SPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate spLICE erbB-2 are useful for treating cancer. Substances which stimulate spLICE erbB-2 are useful for treating cancer. Substances which stimulate erbB-2 are useful for treating cancer. Substances which stimulate erbB-2 are useful for treating cancer. Substances which stimulate erbB-2 are useful for treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone contrain conditions in the degeneration of tissues occurs, such as arthropathy, bone

```
The HER2 proto-oncogene encodes a tyrosine kinase receptor, which functions in cellular signal transduction. The HER2 protein is implicated in breast cancer. The HER2 receptor mRNA exists in at least two forms: a normal form and a truncated form. The present sequence is the normal form RNA of HER2. The truncated form RNA sequence of HER2 (AAA62126) encodes a protein associated with increased resistance to the growth inhibiting effects of a monoclonal antibody. Herceptin, used in cancer treatment. The truncated form of the transcript contains unique structures not found in the normal form. The present sequence is predictive of Herceptin-resistant cancer and detection of the present sequence may therefore be used as a method of diagnosing breast cancer. Other diseases which may be identified by using a similar method to detect other RNA molecules are hyperproliferative conditions, Lupus erythematosus, psoriasis, inflammation, cardiovascular disease, pain, arthritis, obesity, trauma, Huntingdon's disease or neurological

 plasmid piTL-hHER2/neu comprises base vector piTL (see AAV21724) and a human HER-2/neu nucleic sequence. piTL-hHER2/neu was used to cavaluate the toxicity of anti-tumour vaccination in rats, and in phase I and phase II trials to evaluate polynucleotide vaccination in advanced breast cancer. Novel humanised vectors, which can be based on piTL, comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells sequence, generating an immune response in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the carpet.
 Humanised polynucleotide vectors - comprising human derived promoter and sequence acceptance site, used for the production of vaccines

 The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodiamer of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the different coulypeptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominibodies have
 cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas,
 The present sequence is a fusion construct comprising DC8 single-chain FV (scrv) fragment at the N-terminus, extracellular domain of human erbB2 at the C-terminus and a tetramerisation domain between them. This construct was prepared to find out whether an Oilsquerisation domain characterised in bacterial expression system is applicable for expression of fully functional and secretable recombinant protein in mammalian host cells. This tetrameric construct was not expressed as secretable and fully functional protein in mammalian cells. Hence general applicability of the tetramerisation domain for oligomerisation strategies in mammalian cells was ruled out.

 The present sequence encodes the human HER-2/neu protein, HER-2/neu is a member of the tyrosine kinase family of receptor-11ke divpoproteins and shows homology to the epidermal growth factor receptor (EGFR). It probably plays a part in cell growth and/or differentiation. The HER-2/neu gene is an oncogene. An HER-2/neu diston protein comprising a HER-2/neu extracellular domain fused to a HER-2/neu phosphorylation domain may be used to treat or prevent cancer by eliciting or enhancing an immune response to the HER-2/neu phosphorylation to treat malignancies such as breast, ovarian, colon, lung and protein cancers, and may be used as an antigen to vaccinate against

 The invention relates to a method of inducing a cell-mediated immune response against a cell comprising a target antigen (I) in a subject, treating a subject having undesired cells, for example tumnour cells or virally infected cells (C), reducing the number of (C) in a subject, and stimulating presentation of (I) by a cell. This is done by a diministering a polynuclectide (II) encoding a variant of (I), so that (II) expressed in a cell and cell-mediated immune response is induced. The method can be used to treat prostate cancer, breast cancer, colorectal cancer and pancreatic cancer, as well as lymphomas and leavaemias. The method is also useful in treating chronic viral infections such as those caused by hepadnaviruses, lenturinses (including human immunodeficiency virus (HIV)), herpesviruses and the flaviviruses and pestiviruses. The present sequence represents the coding sequence of human breast cancer antigen, Her2 variant, used as a target antigen in the method of the invention.
 Inducing a cell-mediated immune response against a target antigen, reducing undesired cells and stimulating presentation of an antigen by a cell, comprises administering a polynucleotide encoding a variant of an antigen -

Human HER-2/neu oncogene cDNA (AAT40739) codes for HER-2/enu (p185 or c-erbb2) protein (AAM01111). The oncogene is overexpressed in various cancers, including breast, ovarian, colon, lung and prostate, and appears to induce malignancies through quantitative mechanisms that result from increased or deregulated expression of an essentially normal gene product. Nucleotides 2026-3765 of the cDNA sequence code for the intracellular domain (Ly8676 val1255) of the HER-2/neu protein, which is useful for immunisation against malignancy. Nucleic acids can be used to direct expression of the intracellular domain in transformed host cells, or are used, alone or in a viral vector, for genetic immunisation of an animal.

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGT8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
 human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively.

 This sequence encodes the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for ellciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence.
 Use of HER-2/neu polypeptides - for eliciting an immune response to an HER-2/neu associated malignancy, particularly for treating or preventing tumours

 The invention provides an isolated antigen-presenting cell, which expresses at least an immunogenic portion of a polypeptide that produces an immune response to HER-2/new protein. The antigen-presenting cells are useful as vaccines for eliciting or enhancing an immune response to HER-2/new protein, particularly in treating or preventing malignancies in which the HER-2/new oncogene is associated. Specifically, these are useful for treating or preventing cancer, e.g. breast cancer, ovarian, colon, lung or prostate cancers. The present sequence represents a DNA encoding the human HER-2/new protein (also known as pl85 or c-erbb2).

with a double-stranded (ds) structure of at most 49 sequential in a cert with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (Si, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the

 invention.
```

```
(ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, particularly oncogenes, cytokine genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability. ABX0936-ABX10075 represent gene fragments used to illustrate the method of the invention.

אוו 186134 bp DNA linear ROD 17-NOV-2001 Mouse DNA sequence from clone RP23-355L10 on chromosome ll, complete sequence.
 IMPORTANT: This sequence is not the entire insert of clone RP23-355110 It may be shorter because we sequence overlapping sections only once, except for a short overlap. The true right end of clone RP23-355110 is at 186134 in this sequence. The true right end of clone RP23-438D7 is at 2000 in this

 ROD 16-APR-2003
 Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LINL at: http://image.llnl.gov Series: IRAK Plate: 54 Row: c.Column: 18 This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF
 Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.
1 (bases 1 to 2083)
 Ξ.
 Mus musculus
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
 Submitted (04-APR-2002) National Institutes of Health, Mammalian Gene Collection (MGC), Cancer Genomics Office, National Cancer Institute, 31 Center Drive, Room 11A03, Bethesda, MD 20892-2590,
 BC027080 2083 bp mRNA linear ROD 16-APR-Mus musculus v-erb-b2 erythroblastic leukemia viral oncogene homolog 2, neuro/giloblastcma derived oncogene homolog 2, meuro/giloblastcma derived oncogene homolog (avian), mRNA (cDNA clone MGC:38648 IMAGE:5356166), complete cds.
